WOODWARD'S

COTTAGES AND FARM HOUSES

BY

GEO. E. WOODWARD,
ARCHITECT,

AUTHOR OF

"WOODWARD'S COUNTRY HOMES;" "WOODWARD'S NATIONAL ARCHITECT;"
"WOODWARD'S SUBURBAN AND COUNTRY HOUSES;" AND
"WOODWARD'S GRAPERIES."

NEW YORK:
THE AMERICAN NEWS COMPANY,
39 AND 41 CHAMBERS STREET.

ENTERED, ACCORDING TO ACT OF CONGRESS, IN THE YEAR 1867, BY

GEO. E. WOODWARD,

IN THE CLERK'S OFFICE OF THE DISTRICT COURT FOR THE SOUTHERN DISTRICT
OF NEW YORK.

To Martha

Remember, Ah! Remember
When we went to school.
Remember Ah! Remember
How we used to be free.

-------------------------------	-----

HOSE who have watched the progress of Rural Architecture for some years past, have noticed a marked advance in architectural design and proportion and convenient and economical interior arrangement; yet, compared with the large number of structures yearly put up, the really attractive and tasteful buildings form the exception, and not the rule. Building, at best, is an expensive undertaking, and those who engage in it without

availing themselves of the progressive improvements of the day, make investments from which it is difficult to realize first cost; while he who embraces the principles of beauty, harmony, good taste, etc., rarely fails to command his customer, and a handsome profit when ready to sell. The fact we desire to impress most thoroughly is, that it costs no more to build correctly and beautifully than to ignore all rules of taste, and that every one in this broad land who means to have a home of his own, should have a home worth owning.

The designs shown are mostly of a low-priced description, and the prevailing style chosen is the rural Gothick, the best that is known for cottage structures, being the most economical and useful. Nearly all the designs admit of shingle roofs, which places the workmanship under the owner's control. In new countries, slate and tin roofers, and their materials, are not always available. Handy farm-laborers can shave shingles and make their own roofs; and the pioneer, the well-to-do farmer, the laborer, and the mechanic usually expect to aid in erecting their own buildings.

It is, therefore, impossible to give even an approximate estimate of cost, that shall be reliable, as the prices of labor and materials differ so much in different sections of our widely extended country. A local mechanic can readily do this.

A moderate number of plans for laying out small tracts of land are given; and as our descriptions must necessarily be brief, the illustrations have been so managed as to tell their own story. Many designs for necessary out-buildings are introduced, as the plan of this book covers

all departments of Rural Art. No pains or expense have been spared in making this work reliable. All designs are of a practical character, can be enlarged and worked from; many of them are from actual construction, and all are worth study and attention from any one who contemplates building. We mean that it shall supply a want long felt for designs for convenient and attractive homes for the million. We are largely indebted for assistance in preparing the designs to Mr. E. C. Hussey. Most of the engravings are by Mr. Chas. Spiegle, both of whom have executed their work in a thoroughly artistic and satisfactory manner

FIG. 2.—DESIGN FOR AN ICE-HOUSE.

FIG. 3.—COTTAGE.

FIG. 4.—CELLAR PLAN.

FIG. 5.—FIRST FLOOR.

FIG. 6.—SECOND FLOOR.

DESIGN No. 2.

A LOW-PRICED COTTAGE.

THIS design of two rooms on each floor gives a good deal of available space with independent entrances to each room. To those who must have houses at the lowest possible sum, the bay-window, porch, and finials may be omitted at first, and added at a future day; but by all means preserve the broad projecting roof and the general outline as shown. Let the first-floor ceiling be 8 feet, and use studding of the usual length of 13 feet; this will give a breast of about $3\frac{1}{2}$ feet in second story. Make the height in center 8 feet, and the roof about one third to one half pitch; that is, the height of the roof should be one third or one half the width of the building. Additions can be made at any time when wanted, and will rather add to than detract from the general appearance. The cost of this cottage will range all the way from \$600 to \$1,200; and this difference exists in nearly all classes of buildings, according to the section of country in which they are built, the facility of getting materials, and the business management of the owner. As prices are constantly changing, it is useless to make statements that are only calculated to mislead; indeed, at no former period could prices be furnished without creating much mischief. The best way is to show the nearest good mechanic the design, tell him, as near as possible, your wishes, and he can give the most reliable figures.

FIG. 7.—A COMPACT COTTAGE.

FIG. 8.—CELLAR PLAN.

FIG. 9.—FIRST FLOOR.

FIG. 10.—SECOND FLOOR.

DESIGN No. 3.

A COMPACT COTTAGE.

WE show here a design for a very pretty, compact cottage, that may be erected either with wood, stone, or brick. Rock-faced rubble masonry, over which vines may be trained, would, we think, be very suitable. Those who build houses like this can easily find purchasers for them; indeed, acre-lots in the suburbs of our cities and larger villages, with tasty cottages and a moderate amount of landscape embellishment, would not remain uncalled-for many days. There is a certain steady demand for cosy, comfortable homes adapted to the purses of the great masses that should attract more attention from capitalists. Any convenient locality, where the nucleus, composed of a store, a church, a school-house, and a first-rate hotel, can be established, could be made very attractive, and induce many to leave the crowded and unhealthy tenements of the city for a home in the country, be it ever so small. The complete cost of such an establishment in the country, at a less distance in point of time from the City Hall of New York city than Thirty-fifth Street, would not exceed the yearly rental of a not much more commodious house in the city, while its annual increasing value amounts to more than the legal rate of interest.

FIG. 11.—AN OCTAGONAL COTTAGE.

FIG. 12.—CELLAR PLAN

FIG. 13.—FIRST FLOOR.

FIG. 14.—SECOND FLOOR

DESIGN No. 4.

AN OCTAGONAL COTTAGE.

FOR the sake of a little variety in form, we here introduce a cottage having octagonal ends, and the principal rooms on the first floor of octagonal form. These rooms, furnished with a fair degree of taste, will present a cosy appearance. The roof covers the building in the same manner as if it had square corners, and is supported by a neat bracket of timber-work. Those who do not fancy this suggestion, can adopt a similar plan with square angles at the corners, and omit the brackets under the roof. The arrangement of the windows in the octagon ends gives better facilities for ventilation than if both windows were on the same line of wall, which they would have to be to preserve the symmetry of a square room. In the construction of this house use the "balloon frame," because it is stronger and forty per cent. cheaper than any other—for a full illustrated description of which see "Woodward's Country Homes." Instead of filling in with brick, sheath the outside of the studding horizontally with rough boards, and over this put the siding; a layer of tarred paper placed between would be serviceable. This will make a strong, warm house.

FIG. 15.—A FARM-COTTAGE.

FIG. 16.—CELLAR PLAN.

FIG. 17.—FIRST FLOOR.

FIG. 18.—SECOND FLOOR.

DESIGN No. 5.

A FARM COTTAGE.

THIS design will answer well for a farm-cottage, presents a good variety, and would be considered an attractive home. We have had in view a moderate expenditure, and of course the builder must be satisfied with a moderate amount of room. Prices we might give, if we were satisfied they would be any guide; but a book like this, having a national circulation, can not be of any value whatever as to cost of construction. We have seen the time when, in the immediate vicinity of New York, this cottage could be built for \$500, or even less. It might possibly be built now for \$1,200; yet in some sections of the country, labor and materials can be had for half the prices they command here. There are many portions of the West where, at the present time (fall of 1866), this cottage could be fully completed for \$400 to \$500. An ingenious farmer, who can supply from his farm a considerable portion of the materials, do his own hauling, and with the aid of a skillful mechanic and one or two handy laborers, if the work be not pushed on too fast, could execute this and similar designs by the use of very little money.

FIG. 21.—PLAN OF FIG. 22.

FIG. 22.—ICE-HOUSE.

DESIGNS Nos. 6 AND 7.

ICE-HOUSES.

Ice is an article that may, with many, be considered indispensable. Those who have enjoyed its use are unwilling to do without it. The comforts of the household are materially increased, and an abundant supply is a great luxury.

Ice-houses may be constructed to suit all tastes and purses; and the various designs we give can be built plainly as well as elaborately. About twelve feet cube of ice is the requisite quantity for most families, and a bulk of this size keeps better than if smaller. The best houses are those built entirely above ground, though one, as shown in fig. 19, which is built into a gravelly bank is not objectionable. Thorough drainage is essential, and where a pipe is used, it should be trapped, to prevent a current of air. The sides should be double, with from 8 to 12 inches space, and packed with wet tan, sawdust, or pulverized charcoal, well rammed down. Sometimes double walls of this kind are made, with an air chamber between; and sometimes an air chamber is made by furring out and lining with boards only. At the bottom we prefer, after the drainage has been provided, to lay a good plank floor; cover this with 6 or 8 inches of sawdust or tan, and then pack the ice (which should be from 6 to 8 inches or more

in thickness) in layers, putting the blocks as close together as possible, and chinking up with small pieces of ice or snow. A space of about 6 inches should be left between the mass of ice and the sides of the house, which should be thoroughly packed with sawdust or tan. When the house is full, put over all the ice a layer of sawdust or tan at least one foot in thickness, and pack it down thoroughly. A good roof should be provided, and ventilation of a most thorough character. A draft of air through the ice would soon destroy it; a draft of air above it only is an essential preservative. In constructing these houses, it would be better, in addition to the openings shown, to leave a space from six inches to one foot wide, under the eaves, above the plate, both sides the entire length of the house. This opening is protected from the rain, and the free admission of air thus secured is of great advantage.

Straw and hay are used sometimes for packing in place of sawdust or tan, but are not so serviceable. In each of these designs there is a cooling-room attached for milk, butter, meats, fruits, etc., marked A on the plans. The room marked B is the one in which the ice is packed; the floor is laid so that the drainage runs to one point, and is carried off by a pipe trapped, to prevent the admission of air.

ORNAMENTS IN LANDSCAPE GARDENING.

DESIGN No. 8.

FIG. 23.—RUSTIC STAND.

WILD ground and irregular surfaces call for rude and bold work. Here introduce rustic bridges crossing ravines, rustic seats, vases, baskets of rustic work, gnarled and curious roots encircling boxes of plants, hollow stumps and dead trees supporting climbing plants, rustic kiosks on spots which offer agreeable resting-places and command fine views; all such objects are appropriate to grounds so

characterized. There is no particular beauty in a piece of rustic work in itself, but when properly placed it becomes beautiful from its association, and in turn enhances the picturesque of the grounds about.

DESIGN No. 9.

FIG. 24.—SUN-DIAL.

AMONG the many objects used for adornment, there is a very pretty one which we would like to see more frequently employed, and which when properly placed by the side of some walk well retired from other objects, is

in itself highly suggestive. We refer to the *Sun-dial*. What thoughts this monitor suggests to the mind! how silent, yet how eloquent! His must be a vacant mind indeed who can pass such a teacher without finding thought to accompany his walk. A shadow teacheth us, and we learn in the end that we have pursued but shadows.

In the beautiful words of the poet:

“This shadow on the dial’s face,
That steals from day to day,
With slow, unseen, unceasing pace,
Moments, and months, and years away;
This shadow, which in every clime,
Since light and motion first began,
Hath held its course sublime—
What is it? Mortal man!
It is the scythe of time—
A shadow only to the eye;
Yet in its calm career
It levels all beneath the sky;
And still, through each succeeding year
Right onward with resistless power,
Its stroke shall darken every hour,
Till nature’s race be run,
And time’s last shadow shall eclipse the sun.”

FIG. 25.—WELL-HOUSE.

FIG. 26.—PERSPECTIVE.

FIG. 27.—CELLAR PLAN.

FIG. 28.—FIRST FLOOR.

FIG. 29.—SECOND FLOOR.

DESIGN No. 10.

THE additions of porches, verandas, bay-windows, etc., increase the effect of cottage-houses to a very considerable degree, add much to interior convenience and beauty, and, if put on at the time when the building is constructed, do not materially augment the expense. We think they are always worth their full cost, and rarely fail to make an impression upon the eye of a purchaser. The interior wood-work of this cottage, or any other, should be selected with some little care, and all stained—either satin-wood or light black-walnut. These stains, which can be easily procured, are better if laid on in oil, and then, if covered with two coats of varnish, make the nearest approach possible to the appearance of the above-named natural woods. No grainer's art can do as well. Handsomely stained and varnished wood-work is, we think, the most superior mode of treating interiors. It adds much to the warmth and cosiness of the rooms, has the effect of furnishing, and, so far as cleanliness is concerned, is of great help to the housekeeper. This style of finish, whether for the humble cottage or costly mansion, is better and more attractive, if done with good taste, than the most costly and elaborately painted tints.

FIG. 30.

FIG. 31.—CELLAR PLAN.

FIG. 32.—FIRST FLOOR.

FIG. 33.—SECOND FLOOR.

*Remember, 'N! Remember
When we went to school.*

DESIGN No. 11.

This design can, for the amount of room afforded, be constructed very cheaply. The kitchen is shown in the basement plan, but can be put on the first floor, or in a rear addition, if deemed more convenient. If built in an exposed situation, some filling-in between the studding will be necessary. There are several modes of doing this, all of which add to the stiffness and solidity of the frame, and ward off the searching winds. An air chamber for confined or dead air adds much to winter warmth and summer coolness, and this is usually provided for. The most common mode of filling-in is with soft brick laid on edge in mortar; grout is also made use of. Back plastering, or lathing between studs—nailing common laths or rough pieces against strips fastened to each side of the studs and covered with coarse mortar—is serviceable. Where lumber is plenty, cover the frame with rough boards, and put the weather-boarding on the outside of the rough boarding; this we have found answers an excellent purpose. A layer of common tarred roofing-paper between the two courses of boarding will render the house impenetrable to wind or rain, and affords one of the best means of protection.

DESIGN No. 12.

A HOUSE FOR DRYING FRUITS.

THE following sketch, received from J. C. Hobson, Esq., Cardington, Ohio, is of a building of moderate dimensions, 4 by 12 feet, and 5 feet in height, set upon a wall of brick or stone 20 inches high; and to obviate the necessity of going inside when heated up for drying, it is constructed with two tiers of drawers on either side, 23 inches by 5 feet, with slat or wire bottoms, each one made to slide in and out independent of the rest, and each tier inclosed with double doors. The building is heated by means of furnaces extending from either end, and communicating with the flue in the center.

FIG. 34.—DRYING-HOUSE.

By reason of the drawers meeting over the furnaces in the middle, the heat in rising is compelled to pass through them, thus the fruit is dried faster than by the usual mode of placing it on shelves against the wall of the house.

The number of drawers may be increased to double the amount represented in the drawing, if necessary, which would make them hold a considerable quantity of fruit, say from twenty to thirty bushels.

ORNAMENTAL ROADS.

A PROPER location of an ornamental road adds to it, we may say, all of its character and importance, and it may be made in inexperienced hands a very tame and meaningless affair. To locate and make a road that shall fulfill only a useful purpose is one thing; to so locate it that it shall comply with all the requisites sought for in ornamental grounds, is quite another matter. Whatever there is of consequence should be made the most of, and by the most graceful and easy lines of curvature should destroy the thought that anything of the kind was intended. The entrance, the perspective view of the dwelling, the easy grade, the drainage, construction, planting, etc., are only thoroughly considered by those of extensive practice.

Where proper materials for road metal can not be had, or where expense is to be avoided, the earth road must be adopted. To make this is an easy matter; thorough drainage, wherever necessary, should be most carefully done. The bed of the road should have a crowning of about 4 inches in a width of 16 feet, or half an inch to a foot, both ways from sides, as shown in fig. 36. The sods at the edge should be kept low—not over $1\frac{1}{2}$ inches high, except in such cases as where surface drainage crosses the road, and is liable to wash earth on to the lawn. The grade line in the direction of the road should be kept as regular as possible, and avoid undulating. On the surface of the

FIG. 36.—SECTION OF EARTH ROAD.

FIG. 37.—SECTION OF GRAVEL AND STONE ROAD.

FIG. 38.—SECTION OF TELFORD ROAD.

road, gravel, coal ashes, oyster shells, or similar materials, may be placed to good advantage, and will make good roads through all the dry seasons. The making of an earth road similar to this is in all cases necessary where the road bed is to be stoned, except that it is taken out to a greater depth. The most common mode of making a stone road is after the manner shown in fig. 37. Stones of unequal size are laid in, or usually thrown in, to a depth varying according to the builder's notion, generally one foot and over, and covered with 4 to 6 inches of gravel. The chief objection to it is, that it requires a larger amount of excavation; if the stones are not carefully hand-packed and rolled, they are liable to work out on the surface; heavy loads, as coal, hay, manure, etc., will cut them up, and weeds will grow thickly and rapidly. In a park, on properly constructed roads in constant use by light carriages, these objections would have no weight. Still, by a greater expenditure of labor in keeping them in order, such roads, when well made, answer a very good purpose; but as an investment they are not so good as other kinds that do not require so much care. The first cost is less than broken stone roads. They should not, under ordinary circumstances, exceed 10 inches of thickness of stone and gravel.

Fig. 38 illustrates the manner of constructing the Telford road, a valuable and well-tested plan, good in all localities where stone can be had, and admits of a softer and inferior quality of stone being used in the pavement. Telford approved of a level cross grade instead of a convex surface. Hughes, a later author, declares the convex

FIG. 39.—SECTION OF MACADAM ROAD.

FIG. 40.—SECTION OF BAYLIFF ROAD.

FIG. 41.—HAMMER FOR BREAKING STONE.

FIG. 42.—MODE OF FORMING GUTTERS.

line to be the best, which it undoubtedly is. This road is made by first setting a rough pavement of stone, as shown in fig. 37. The projections of the upper part are broken off with a hammer, and the interstices are packed with stone chips or spawls. On this pavement are placed two layers of road metal, and the whole is covered with gravel or some other good binding material. The whole thickness for an ornamental road need not be over 10 to 12 inches.

Fig. 39 shows the manner of making the McAdam road. This consists entirely of road metal; that is, stone broken to a cubical form of $2\frac{1}{2}$ inches, and put on in three layers, each of which is worked together by carriage wheels, and the final surface made smooth by constant use. It becomes in time a solid, compact, impenetrable body, the stone uniting by its own angles, aided by the dust ground from them by constant use. This class of road-making is not adapted for private estates, in consequence of the time and use required to make the surface smooth; and the fine dust is objectionable.

Fig. 40 is a cross section of what is known as the Baylton system, and is, we think, the most superior manner known of constructing either public highways or private ornamental roads. It consists of a layer of road metal 6 inches in thickness placed on in one solid body, thoroughly rolled, and covered with about $1\frac{1}{2}$ inches of blending material, good gravel being the best. We have, however, in an extensive practice, built these roads with a layer of road metal of 4 to 5 inches thick, and with just gravel enough to finish the surface even, one of which, after

eight years of constant use, does not appear to have failed in the slightest particular. It has, through all seasons, presented a hard, smooth, handsome surface. This system of road-making requires the least quantity of excavation, and can be made ready for use at once. Its construction is the simplest of all modes, and its durability and efficiency have stood the test of thirty years.

The prevailing impression is, that the stone and gravel road, fig. 37, is the cheapest to construct; a very doubtful matter, we think, compared with the Bayldon plan. One thing is certain, however, that to keep the stone and gravel road in polished order, in private estates, requires at least four times the care; and if a little is saved in first cost, it is soon balanced by additional expense. Where economy in building a good road is to be considered, the stone might be broken at leisure intervals through the winter, and by those unfitted by age or misfortune from doing the work of able-bodied men. The stone is broken with a steel hammer weighing about $1\frac{3}{4}$ lbs. (see fig. 41). The stone-breaker sits at his work, and soon becomes very expert. Some use long-handled hammers, and stand up, but can not accomplish much.

Where it becomes necessary to form gutters, we think it best to do so with quarried or fractured stone put together in the usual manner of making a pavement (see fig. 42). The advantage is, that the gravel may be raked in a thin layer on the gutter (which is always unsightly), and the ragged edges of the stone will hold it, and prevent its being washed. Cobble-stone gutters answer a good purpose, but can not be so easily concealed.

FIG. 43.—A FARM-HOUSE.

FIG. 44.—CELLAR PLAN.

FIG. 45.—FIRST FLOOR.

FIG. 46.—SECOND FLOOR.

DESIGN No. 14.

A FARM-HOUSE.

THIS design is for a farm-house of an irregular exterior form, covered by a roof without valleys, except those by the dormer window.

As the plan provides for sleeping-rooms on the first floor, about the healthiness of which opinions differ, we quote the following from the New York *Tribune* reports of the discussions of the New York Farmers' Club:

"Sleeping-Rooms, are Elevated Ones most Healthy?"
—ISAAC BOND, Washington City.—'Are low-story rooms equally healthy as lodging rooms with those of upper stories? I have long been led, perhaps more by prejudice, or the opinions of others, than by facts or good reasons, to believe up-stairs decidedly the better; but finding the one-story plans given in Miss Beecher's book, without a hint or misgiving as to their being less healthful, while the sole or chief object of the work, which appears excellent in all other respects, so far as I have read it, is to improve the health of American women, I have been led to question my old opinions, and to inquire whether sleeping on the first floor would do more harm to my whole family of five, than going to the second story about ten times a day would do my wife, who is not very strong, and two very young daughters? If you can furnish facts or sound reasons bearing upon this question, they will

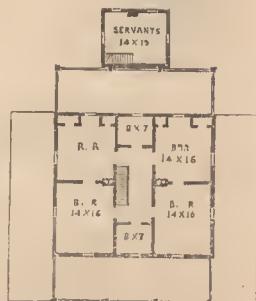

FIG. 49.—SECOND FLOOR.

doubtless benefit many others no less than myself. I may add that economy in building is a very important consideration with me, and I am fully aware that a second story is the cheapest way of getting the same amount of additional room to what we must have in the first story, two rooms, besides wood-shed, etc., as you advise in a late number of the *Tribune*. My situation is on one acre, three miles N.N.W. of the Post-office Department.'

"**OLON ROBINSON**—Let us look at a few simple facts, which may, perhaps, upset the writer's prejudice about the unhealthiness of lodging in lower rooms. Nearly all of the ancient farm-houses of New England had one, and frequently three or four beds upon the lower floor. The people in those days certainly were no more unhealthy than they were after it became fashionable to build two or three story houses. About the cruelest wrong of all that a man of ample grounds can inflict upon his family is to build a house which compels them often to traverse long flights of stairs. I am well satisfied, from personal experience and observation, that a properly constructed one-story house upon a dry soil is just as healthy for lodgings upon its lower floor as a higher house would be upon its upper ones. Mr. Bond speaks of the economy of space gained in making two-story houses instead of one. Should the health, comfort, and life of the occupants be sacrificed to economy? Besides, it is only economy in the first cost of building material; in all after-years it is a serious loss of labor to all the family who are compelled to ascend to an upper story daily, and frequently hourly, to perform their necessary household duties. An up-stairs sick-room

DESIGN No. 16.

A COTTAGE STABLE.

FIG. 50.—PERSPECTIVE VIEW.

FIG. 51.—PLAN.

is particularly inconvenient. It is bad enough for people who live in cities to suffer from such disadvantages. It is positively wicked for a man building in the country to ape the fashion of city houses. Be assured, sir, there is no reason why the lower rooms of a one-story country house should be unhealthy for lodging. Probably one of the main reasons why houses have of late years been built so high is owing to the expensiveness of roofing materials. That difficulty is likely now to be obviated. Roofing made cheap, durable, and safe from danger of fire will tend to a great improvement in the style of our farm-houses. If we discuss the subject enough to awaken the public mind to a sense of its importance, we shall one of these days get back to the comforts of one-story houses.

"R. H. WILLIAMS—I entirely agree with the opinions expressed by Mr. Robinson. I would never recommend building a farm-house over one and a half story high. That is the most economical, as that form will afford all the sleeping-rooms necessary to be placed on the upper floor, at a much less cost than they could be made in a full-storied house, and, besides, it looks more fitting as a farm-house. A two or three story house is inconsistent with the wants of the farm, and shows bad judgment in those who build them. This is one of the most important questions we have had before the Club, and one which affords room for ample discussion. It is sometimes very remarkable to see how one man gives fashion and form to all the dwellings in the vicinity. If some pretentious builder leads off with a high-storied house, no matter how inconvenient, others are very apt to ape the fashion. In

one section of this State, the almost universal style is a two-story center, with two one-story wings. The most that can be said of that form is, that it is fashionable. Anything that we can say here to improve the style of farm-houses will be beneficial to a great many people.

"Mr. DISTURNELL contested against lower-floor lodging-rooms, because he was satisfied they were much more unhealthy than upper ones. He endeavored to prove it from some statistics drawn from Cairo, Egypt.

"Mr. ROBINSON said his position was taken for a dry, hard, rocky soil, like that of New England generally, and not for malarious Egypt.

"The CHAIRMAN said that Judge Butler, formerly a physician at Norwalk, Conn., declares that when people were in the habit of sleeping in lower rooms, maladies prevailed which are now seldom heard of, such as a low grade of fevers. He says prevailing fogs never rise above fourteen feet high, and those sleeping in upper rooms escape its influence. His recommendation to all who build country houses is to make the cellar under the entire house, cementing the bottom and sides so thoroughly that no gas can arise from the earth; and never to sleep on the lower floor. Besides keeping the cellar clean, care should also be taken to clean the well every year. Dr. Ward, who lives near the great salt-marshes of New Jersey, says, from his house, which is situated on a hill, he can look down upon the banks of fog lying upon a lower level. All of our sleeping-rooms are upon the upper floors, and, I think, in a more healthy stratum of the atmosphere than they would be if less elevated.

"Dr. SNODGRASS—This may be so in that locality, but there are others where the case is reversed. Those living immediately upon the banks of the Potomac, and other Southern rivers, have often escaped malarious diseases, while the houses situated upon the adjoining hills or bluffs were so sickly some seasons as scarcely to be habitable.

"HENRY WARD BEECHER—A few miles south of Indianapolis, upon a high bluff of White River, one of the highest in that locality, in the early settlement of the country, there was a town built. Upon the opposite side of the river there was a small settlement, but slightly elevated, upon the water level. According to the usual theory about malaria, these houses should have been sickly, and those in the town healthy; the reverse was the fact to such a degree that the town was entirely abandoned, and the houses left to decay and waste. The laws of health are not always to be measured by high or low situations, nor by high or low sleeping-rooms, if they are properly ventilated."

FIG. 52.—A BIRD-HOUSE.

DESIGN No. 17.

PLAN FOR LAYING OUT A THREE-ACRE LOT.

BY E. FERRAND, DETROIT, MICH.

FIG. 53.

- A, Dwelling-House.
- B, Stable, Barn, etc.
- C, Barn-yard, with three openings.
- D, Grapery.
- E, Greenhouse.
- F, Water.
- H, Kitchen Garden.
- I, Grapevine Arbor.

- K, Place for small fruits.
- L, Strawberries.
- N, Flower-beds.
- O, Places for rustic seats.
- P, Principal Entrance.
- R, Entrance to the Barn.
- S, Gardener's House.
- V, Dwarf fruit trees.

THIS garden has the appearance of a much larger place than it really is; in fact, the plan could be applied to a place of ten or more acres just as well as to the limited space of three. The roads are numerous. It is intended for a lot in the proximate vicinity of the city, and to be occupied by a man who has means to keep it in order.

All these gardens are intended for the same purpose, and laid out according to the same principle; that is to say, the most is done to conceal their narrow limits, and leave one to guess how far one may be from the end of it when one is no more than ten feet from the well-concealed fence; at the same time, all the secondary buildings, such as barns, stables, etc., are very close to the main house, though they are entirely out of sight.

In the plan, smoothly-curved walks are drawn in the thickets of large trees; there is also a vine arbor, which is a handsome ornament. The kitchen garden occupies about one acre and a quarter, and is in proportion to the whole extent of the place.

FIG. 54.—CHICKEN-COOP.

FIG. 55.—A SMALL STABLE.

FIG. 56.—GROUND PLAN.

DESIGN No. 18.

A SMALL STABLE.

BY G. E. HARNEY, ARCHITECT, COLD SPRING, PUTNAM CO., N. Y.

This design for a small stable has accommodation for two horses and a cow, besides a separate apartment for carriages, and another smaller room for harnesses, etc.

The carriage-room measures 13 feet by 22. Each horse-stall is $5\frac{1}{2}$ feet wide, and $9\frac{1}{2}$ feet long to the rear of the stall partition, or 17 feet to the partition of the carriage-room.

The stalls are provided with cast-iron mangers and iron hay-racks, each secured to opposite corners of the stall. We consider these iron fixtures the best in use, but care should be taken to keep them always coated with some kind of paint, to prevent injury to the horses' mouths in winter, when they are liable to become frosted.

The cow-stall is $4\frac{1}{2}$ feet wide, and is provided with a manger and some suitable fastening apparatus; for the latter, we prefer the ring and chain, though the old-fashioned stanchion is recommended by many.

The floors of the stalls should be laid with smoothly-planed loest joists, slanted toward the gutter just enough to take away the water—say 2 inches in the $9\frac{1}{2}$ feet.

The harness-room is provided with hooks for harness; a closet to keep brushes, soap, oils, medicines, etc., etc., and a small stove to heat water for washing harness, etc.

There is a rain-water cistern, built with brick and cement, in the yard, near the rear of the stable, and this, taking water from the roof, by means of tin conductors, supplies all the water required.

Rain water is much better for stock than spring water. The pump is inside the stable, as will be seen in the plan, and empties into a trough, convenient to which are chests lined with tin, for holding oats and meal, etc.

A ventilating shaft rises from the stable-room to the ventilator shown in the sketch, and this, with the small windows in the head of each stall, provides sufficient circulation of air. In the summer, the doors may be taken off their hinges, and gates with locks substituted in their place. The little windows spoken of are placed *above* the heads of the horses—say 7 feet from the floor, and are opened by means of a pulley and rope.

At the rear of the building, a door opens into a yard inclosed by a high fence; and if there be a desire to make the establishment quite complete, there may be built around this yard a range of buildings for poultry, pigs, etc., and open sheds for wagons and carts.

This stable is built of wood, and covered with vertical boarding and battens; the roof is covered with slate; the doors all have simple hoods as well as the windows; and the glass for the latter we would have set in diamond-shaped panes, which, at a little or no extra expense, heightens wonderfully the artistic effect of such a building as this.

Paint the building a warm cream-color, the eaves, and window-trimmings, and doors considerably darker.

FIG. 57.—PLAN OF FOUR ACRES.

FIG. 58.—PLAN OF FIVE ACRES.

FIG. 59.—PERSPECTIVE VIEW.

FIG. 60.—CELLAR PLAN.

FIG. 61.—FIRST FLOOR.

FIG. 62.—SECOND FLOOR.

DESIGN No. 20.

WE show here a compact, convenient cottage, having a conservatory attached for those who love to gratify their taste for flowers. Each room has a cross draft, and can be abundantly ventilated in warm weather. A passage between the kitchen and dining-room cuts off the smell of cooking, and the doors from the kitchen are double, with spring-hinges, and without locks or other fastenings; they are opened with the foot, and close immediately after passing. The servant can pass in the kitchen through one door and out through the other with a large tray of dishes, and thus avoid meeting any one, while flies and the aroma of cooking have little chance of getting into the main part of the house. We think during the summer months it adds much to the comfort of all country houses to put in the windows the neat, modern wire-gauze window-guard, which does not obstruct air or sight, and does keep out effectually flies, millers, gnats, beetles, spiders, mosquitoes, bats, cats, and the whole list of nuisances against which we make our rooms close and dismal, and mope in summer evening darkness to avoid. The safety, cleanliness, and comfort of an open country house, night and day, can thus be enjoyed; light, sunshine, and fresh air can be had in abundance, and a feeling of comfort insured which those who have once tried it would never be without.

FIG. 63.—PORTER'S LODGE.

FIG. 64.—GROUND PLAN.

DESIGN No. 21.

PORTER'S LODGE.

BY GEO. E. HARNEY, COLD SPRING, N. Y.

THIS design represents a porter's lodge, built about a year ago by Mr. F. P. James, and situated near the gates at the entrance to his country place in Cold Spring.

It is constructed of rough stone, quarried in the immediate vicinity, laid in its natural bed, and pointed up afterward with light-colored mortar, and—though we object to the use of this light mortar, preferring the softer tint of the dark—the effect of the whole is very good, the bright green foliage of the trees, by which it is nearly hidden, contrasting well with the dark gray tone of the stone.

Its walls are low, and its roof projecting boldly, covered with slates cut in an ornamental pattern. The tower, which is the principal feature of the exterior, rises from the angle of the front nearest the public road, and contains the stairways to the chamber and cellar.

The plan shows four apartments on the principal floor, as follows:

The hall is approached by two or three steps, leading to a wide porch, covered with a broadly projecting hood, supported on heavy brackets. This hood is, in fact, a continuation of the roof of the main house beyond the

eaves, as is also the roof of the bay window on the adjoining side.

The staircase in the tower is on the right of the front door, and is separated by an archway from the hall.

The room on the left, containing the bay window, is the living-room, and measures 11 feet 6 inches by 13 feet. It opens into a room 15 feet by 11 feet 6 inches, and is used as a kitchen. The other room is a bedroom, and measures 8 feet by 9 feet. The kitchen has a door communicating with the yard in the rear.

The chimney is in the center of the house, and one stack of three flues answers for all the rooms.

There are ventilators on the roof, and a dormer window to light the attic, which has one room finished off for a sleeping-room. All the principal windows are glazed with diamond-shaped panes of glass.

There is a cellar under the whole house, containing bins for coal, store-closets, etc., etc.

FIG. 68.—A PARSONAGE.

FIG. 69.—CELLAR PLAN.

FIG. 70.—FIRST FLOOR.

FIG. 71.—SECOND FLOOR.

DESIGN No. 23.

A PARSONAGE HOUSE.

THIS design was made for a parsonage house, to be erected in one of the immediate suburbs of New York, and is more commodious than any plan we have thus far shown. The frame to be of the balloon style, sheathed with rough hemlock boards, and covered with narrow siding; roof to be slate, laid in alternate bands of different colors, the lower band to have square ends, the next hexagonal, then square, and so on alternately to the ridge; or shingles may be cut and laid in the same manner. To the top of the first-floor beams the frame should be filled in with brick, to keep out the rats; and if the whole lower floor be grouted between the beams, it would be better and warmer. This is often done to prevent the foul air rising from the cellar through the house. No cellar, however, ought to be foul; ventilate and purify it always; do not have any decaying vegetation in it; grout the floor of the cellar, whitewash the walls and ceiling, and let one open shaft of the chimney start from the cellar. It can be, and should be, at all times sweet and clean. Flooring one inch wide pine; casings, baseboards, etc., to be narrow, neat, and plain; doors $1\frac{1}{2}$ inches in thickness, four paneled; and all interior wood-work to be stained and varnished—not painted. Exterior to be light cream color, with rich, dark-brown trimmings. About New York this house can be erected for \$5,000 at present prices of materials and labor.

FIG. 72.

FIG. 73.—CELLAR PLAN.

FIG. 74.—FIRST FLOOR.

FIG. 75.—SECOND FLOOR.

DESIGN No. 24.

THIS design, with a tower, adds a variety to our series, and, in many localities, would be suitable and attractive. The plan shows but moderate accommodation, yet enough to supply the demand called for by the largest number. The roof of the main building can be shingled, but that of the tower would be better of tin. It is shown as a frame house, but would look well constructed of brick; hollow walls, one foot thick; but do not omit furring out. We think there is quite as much need of leaving a vacant space between the plastering and a hollow brick wall as if the wall were solid. The brick which binds a hollow wall will convey dampness, though not as much as solid walls. Our designs are mostly shown as being quite low on the ground. There is nothing arbitrary about this, except that it helps the cottage appearance. In many localities custom or prejudice would raise the foundation wall two or even three feet above the ground. There are some places where it would be healthier and better to do so; but on a dry, gravelly soil, or one thoroughly underdrained, we should not care to show more than a foot of underpinning, unless we contemplated making use of rooms below the first floor.

FIG. 76.

FIG. 77.—CELLAR PLAN.

FIG. 78.—FIRST FLOOR.

FIG. 79.—SECOND FLOOR.

DESIGN No. 25.

THIS design is quite compact, and can be worked out into a very neat and pretty home, and the rooms changed to suit the exposure. Put the hall on the north side, and a south window can be had in three rooms on the first floor and three rooms on the second floor; and if the kitchen wing be extended, and the kitchen removed back, four rooms can, by sliding doors, be thrown together. The ventilation is very perfect, and each room would command good views. For a summer residence, where every breeze is desirable, this would be a good plan; and it is good for many other reasons; it is easily heated, and the housework can be done with few steps.

In the exterior we give, by way of variety, the hipped or truncated gable, a style of finish we do not very much admire, but which will sometimes answer where there is not a disposition to do too much of it. We call to mind a suburban district where one or two leading citizens introduced this notion when it was less common than now, and the fashion thus set has been persistently followed, until it has become quite a disagreeable feature. Make the gables pointed, and this design, both outside and inside, is a good one.

FIG. 80.

FIG. 81.—CELLAR PLAN.

FIG. 82.—FIRST FLOOR.

FIG. 83.—SECOND FLOOR.

Remember, Uh! Remember,

When we went to school.

Remember Uh! Remember

You we used to call the fool.

DESIGN No. 26.

CHIMNEYS are an important feature in the exterior design of a dwelling; and we like to see them treated boldly—good solid base, shaft, and projections, and of sufficient height above the roof as to overlook all other obstructions, and thus insure a good draft. The flimsy stove-pipe look of chimney-pots we do not admire, and would prefer not to make use of them. A well-built brick chimney can be put up cheaper, and is much more effective.

In this cottage considerable exterior ornamentation is shown, which may be omitted by those who do not like so much of it. The finials and crest on the roof help the appearance very much, and make a good finish; the drapery on the cornice may be plainer. Hoods over the windows, to some extent, take the place of outside blinds, and relieve, by their shadows, what might otherwise appear to be a very plain exterior.

The rooms, as shown on the plan, would probably be better if increased in size; though, if one undertakes to build low-priced houses, he must adhere firmly to the plan—a little here and a little there will, when all bills are paid, be found to double the cost.

FIG. 84.

FIG. 85.—CELLAR PLAN.

FIG. 86.—FIRST FLOOR.

FIG. 87.—SECOND FLOOR.

DESIGN No. 27.

WE show here a plain exterior, with a somewhat flatter roof, and full ceilings on the second floor. The bedrooms are all small, and it would probably be better to have a less number, and make them larger, making two rooms out of the four smallest. This roof is what is called one quarter pitch, which is about the flattest that will answer for shingles.

A new roofing material has lately been introduced, called the Mastic Slate, and is highly spoken of by those who have had opportunities to try it. Slate is ground to powder and mixed with gas-works tar, and after being spread with a brush or trowel, becomes in time a sheet of slate. For roofing, it is spread on felting or roofing paper, and the whole expense is very moderate. Our own experience with cheap roofing materials has been quite unsatisfactory, and we have always been glad to exchange them for good tin, shingles, or slate. We would welcome with pleasure the new Mastic Slate, or any other material calculated to reduce the steadily increasing expense of making good, tight, durable roofs. A good material for flat roofs that a farmer can put on himself, is greatly needed.

DESIGNS NOS. 28 AND 29.

FIG. 88.—CANOPIED SEAT.

FIG. 89.—A RUSTIC SEAT.

DESIGN No. 30.

MANY persons desire to build to meet present wants, and add at future periods such rooms and accommodations as shall be needed for a growing family or are better adapted to the prosperity to which they look forward. Beginning with very small quarters in this way, one has a home early in life and a savings-bank at the same time, with a double incentive to take care of his surplus earnings. He who begins in this way, and is determined to succeed, will succeed, and gradually become the possessor of a neat and comfortable home, without any greater expenditure than that yearly made by a city tenant for accommodations not any more convenient. It has been well said, "We can not all live out of cities (though it were better for all that many more did so); but even the young merchant, lawyer, doctor, mechanic, or clerk, who feels constrained to live on a paved street, might advantageously own a bit of land, though miles away. Travel is rapid and cheap; a day in the country is health and happiness; and we nearly all hope to live in the country by-and-by. With an acre or more of good land well fenced, the habitual plodder over pavements may plant in youth or early prime the trees that are to solace his old age; may have his plants, shrubs, vines, and fruits growing, though unable as yet to build a house—may have an occasional foretaste of the calm joys of living his own

master in his own home. No one can realize all the blessedness which centers in home until he comes to have a spot that is truly his own.

"Thousands live and die tenants and hirelings who might far better employ and house themselves. The city hireling makes more money than his country cousin; but strikes and panics, sickness and frolics, with the necessity of giving half he earns for shelter, generally keep him poor; and an increasing family soon drives him to close calculations and shabby shifts to keep afloat. Happy for him and his, for those he takes with him and those he leaves behind, the day that sees him settled in his own cottage, the owner and occupant of a genuine home!"

FIG. 90.

In fig. 90 we show about the simplest form of a house, containing two rooms, as shown in plans figs. 91, 92.

FIG. 91.—FIRST FLOOR.

FIG. 92.—SECOND FLOOR.

In fig. 93 a simple lean-to addition has been made, and this answers for a kitchen, the plan of which is shown in fig. 94.

FIG. 93.

FIG. 94

In fig. 95 we show the next change, which increases the accommodation and adds to the exterior effect. The plan is shown in fig. 96.

FIG. 95.

FIG. 96.

FIG. 97.

FIG. 98.—CELLAR PLAN.

FIG. 99.—FIRST FLOOR.

FIG. 100.—SECOND FLOOR.

Fig. 97 shows the final arrangement, with pleasant, well-located, and convenient rooms, and an attractive and pleasing exterior.

Figs. 98, 99; and 100 show the plans as finished—a comfortable home, representing, we will say, what during ten years past might otherwise have gone into a landlord's pocket; and independent of this saving, there has been an annual increase in value, now double the entire expenditure. Time, in its many changes, adds beauty and value to a country home that is taken care of, whose occupants enjoy and are interested in every tree and shrub, and every improvement that is made. Fruits, flowers, and ornamental foliage develop new attractions; and a little done to-day, and a little to-morrow, while being but healthful recreation, amounts to a good deal at the end of a year.

FIG. 101.—DESIGN FOR A FOUNTAIN.

FIG. 102.—SUBURBAN COTTAGE.

FIG. 103.—FIRST FLOOR.

FIG. 104.—SECOND FLOOR.

DESIGN No. 31.

A SUBURBAN COTTAGE.

BY GEO. E. HARNEY, ARCHITECT, COLD SPRING, N. Y.

WE show here a design for a small cottage, such as one might build on a village lot of sixty or a hundred feet in width. It is of frame, filled in with brick—soft brick, laid on edge in mortar—and covered with vertical boarding and battens, or with narrow horizontal siding; the roof covered with shingles cut in patterns; the cellar of rubble-stone; the wall 20 inches thick, laid in mortar.

The frame is of spruce or hemlock (the former is the best, but the latter is the most generally used in this part of the country), and the outside finish of white pine—the details few and simple, but bold and strong—everything meaning something, and telling its own story. The roof is quite steep, and the projection of the eaves broad, to shield the sides, and the windows are all wide and airy.

The accommodation of the house is as follows: A veranda, 6 feet wide, shielding the front entrance. The hall, containing the staircases to the chambers and cellar, and opening into the several rooms on this floor. Parlor, 14 feet by 16, communicating by French casement windows with the veranda on one side, and with an open gallery on the other side, and having, besides, a large hooded mullioned window in the front. This room has,

also, what we consider indispensable in a country house, be it large or small—an old fashioned open fire-place, for burning wood on the hearth, if wood can be had, or, if not, coal in the grate, and, besides, for purposes of ventilation. We think, for practical reasons, the old poetic sentiment of the family fireside and the blazing log should not be lost sight of, and there should be at least one room in every house—the room that is the most used by the family as a sitting-room—made attractive and healthy by this means.

The living-room, measuring 13 feet by 15, is provided with two good closets, and opens into a little pantry, which is fitted up with a sink and pump, and other pantry conveniences. This opens out upon a stoop to the yard. There is also on this floor a room 8 feet square, which may be used either as a bed-room or as a store-room; it has no chimney, though if one were added, as easily might be, it could be used as an outer kitchen or scullery.

There is a cellar under the whole house, reached by stairs under the main flight. It is provided with a rain-water cistern, bins for coal, and the other usual cellar conveniences of lock-up—cold cellar, hanging shelves, etc. It has a separate entrance of stone steps from the yard, and is 7 feet high in the clear.

In the second story are chambers corresponding severally with the rooms below, and each supplied with a closet. There is no attic, but an opening in the ceiling of the hall communicates with the vacant space above the rooms, and into it ventilates the house, this space having ventilators under the peaks of the gables.

The front chamber has some importance given to it by the addition of an oriel window, after the fashion of some old English cottages—a feature which adds greatly to the brightness of the room, as well as giving some extra space. It is fitted up with a seat, and has glass windows on its three sides.

The interior of this cottage should be fitted up in simple manner with pine; the closets all supplied with shelves, and hooks, and drawers; and the pantry with sink and other fixtures. The walls may have a hard-finished surface, unless it be contemplated to paper them, in which case a cheaper covering can be used.

The inside wood-work may be stained in two shades with umber and oil; and to add to the effect, the finish for the *best* rooms may be of selected stock, so that the finest and best grained wood may be there used.

The outside should be painted three coats of some neutral colors of oil paint—say light browns, or drabs, or grays. The heights of the stories are 9 feet each. The posts are 14 feet long between sill and plate.

FIG. 118.—FIRST FLOOR.

FIG. 119.—SECOND FLOOR.

DESIGN No. 38.

WE show in this design a square house, with the flat or Italian roof, which, for the amount of room obtained, is probably as cheap a style as can be adopted. Projections should all be treated boldly. The location of the house is oftentimes of great importance. It is difficult to persuade those who live in unfrequented districts to place their dwellings back from the road, the passing vehicle or traveler being too acceptable a sight for those who seldom see any one to disturb the loneliness of their situation. In more thickly populated districts this feeling ceases, and a degree of privacy is wished for. As a matter of taste it is better to have a broad and roomy foreground between the house and the street. It gives a finer effect to the house, an opportunity for display in flowers and ornamental trees, greater freedom from noise and dust, and a moderate amount of seclusion.

The great charm of a country home in pleasant weather is its surroundings, and these should always be neatly kept. Roll and cut the lawn regularly; keep the roads and walks in smooth and handsome order; have fine trees, and give them abundant room to grow, and thin out whenever they become crowded. Do not have any more lawn or roadway or walks than can be kept in unexceptionable order. Whatever is done, do well. Better a city lot in fine order than a one-hundred-acre slovenly farm.

FIG. 120.—A DOCTOR'S RESIDENCE.

FIG. 121.—GROUND PLAN.

DESIGN No. 39.

A DOCTOR'S RESIDENCE.

BY G. E. HARNEY, ARCHITECT, COLD SPRING, N. Y.

THIS design was built about two years ago, by Dr. P. C. Parker, of Cold Spring, and is situated on a fine piece of ground near and overlooking the village, and embracing beyond fine views of the Hudson, West Point, the Newburgh Gap, and the ranges of mountains above and below.

The house stands between the approach road and the river, consequently the entrance porch is on one front—that toward the road—the living apartments and veranda are on the opposite side, fronting the river; by this means greater privacy is given to those portions of the house usually occupied by the family.

The arrangement of the plan is as follows:

The front veranda, No. 17, opens by wide doors into a vestibule, No. 1, 7 feet square; No. 2 is the hall, containing the staircases, and No. 3 is a small room or recess, opening by means of a French window upon the principal veranda, which extends around the river side of the house. The hall and recess are separated from the main hall by Gothic arches with ornamental columns and molded spandrels; No. 4 is the Doctor's business office, which has a separate entrance for persons calling specially on him,

seen at No. 5; No. 6 is a comfortable little library, furnished with book-cases, and having an ornamental chimney-piece; it has two windows, which give pleasant north and west views; No. 7 is a parlor, about 16 feet square, exclusive of the bay window, which projects from its western side about 5 feet, and around which the veranda extends; No. 8 is the dining-room, 15 feet by 16; and No. 9 is a small butler's pantry, fitted up with shelves and cupboards, and opening into the kitchen, No. 11. The kitchen is in the southern wing, and is furnished with sink and other kitchen conveniences; No. 10 is a scullery, fitted up with cupboards and a sink, and supplied with hot and cold water; the dishes are washed here, and passed into the butler's pantry through a small opening left for that purpose in the wall between them, and on a level with the wide shelf of the pantry. A door from the kitchen opens out upon a private veranda, No. 13, which is entirely shut in by lattice-work, and this is used in summer as a laundry or washing-room; No. 14 is the outside stairway of stone, leading to the cellar; and No. 15 is a water-closet, made in a hollow space between two walls, and ventilating through this space into a flue of the kitchen chimney, running along by the side of the kitchen flue. The warmth of the kitchen flue produces a current of air in the ventilating flue, and by this means the water-closet is fully ventilated, and though quite near the house, is always cleanly and inoffensive. Private stairs from the kitchen lead to the chamber floor and to the cellar. The cellar has a laundry under the kitchen, a large store-room under the butler's pantry, and an open cellar under the rest of the

house, where are the brick cistern, the furnace, coal-bins, wine-closet, and other conveniences usually found in this portion of the house.

In the second story are two square chambers, with full ceilings, over the parlor and dining-room; two rooms for servants, besides a bathing-room over the kitchen; and a stairway to an unfinished attic over the central portion of the house; a chamber over the library, and a large linen room over the office; all these rooms are well lighted and well supplied with closets.

The house is built of wood, filled in with brick, and sided with narrow pine siding; the roofs throughout, including the window hoods, are all covered with slate, put on in alternate bands of green and purple. The interior walls and ceilings are hard-finished, and the interior wood-work is stained and oiled—three different shades being used for the staining—dark umber, light umber, and annatto. The exterior is painted three different shades of oil paint—of browns and grays—and the doors are grained like oak and walnut. The rooms in the principal story are 10 feet high, and those in the chambers are 9 feet high.

FIG. 122.—DESIGN FOR A WELL-HOUSE.

DESIGN No. 40.

ICE-HOUSE, COOLING-ROOM, TOOL-HOUSE, AND WORKSHOP
COMBINED.

IN this design, the ice is placed in the second story of the main building. The drainage from the ice cools the room below, in which are to be placed meats, fruits, butter, etc. One wing is for a tool-house for farm and garden tools, the other for a workshop. The section is taken lengthwise through the center.

DESIGN No. 43.

A DIFFERENCE of opinion has, and probably always will exist about the materials of which a house should be constructed. We use in this country three leading varieties, wood, brick, and stone, and, to a limited extent, grout and iron. Wood is the cheapest, and if very nice points are considered, is probably the healthiest, certainly the driest. Frame houses have also superior qualities for ventilation, a subject very little understood by those who advocate impenetrable walls and double windows. So little progress has been made in understanding the subject of ventilation, that the commissioners, in advertising for plans for the new Capitol building for the State of New York, mention the necessity of open fire-places for this purpose. Our stone and brick houses, with slate and metal roofs, furnace-heated and air-tight, lack essential qualities for health; while a frame-house, which admits the air more freely, even if it take an extra cord or two of wood, or an extra supply of coal, has a more healthy atmosphere.

Frame houses are good houses, and will outlast the lifetime of the builder; and no matter how strong and substantial a house may be built, it usually passes into strangers' hands at the owner's death.

HOW TO REMODEL AN OLD HOUSE.

FIG. 140.—THE OLD HOUSE.

FIG. 141.—CELLAR PLAN.

FIG. 142.—FIRST FLOOR.

FIG. 143.—SECOND FLOOR.

FIG. 144.—GARRET.

WE show here what can be done with an old house—one built by a retiring citizen, and modeled after his city residence, under the impression, perhaps, it was equally well adapted for the broad open country. We know of many a one who has saved in this manner architect's fees; but such houses sooner or later become subjects for the architect's skill, and not unfrequently a good thing can be made out of them.

Fig. 140 shows the appearance of the old house and the four plans of basement, first floor, second floor, and garret, as they were originally laid out. It is the same thing a thousand times repeated, in almost every densely populated street; every discomfort of a city house, with the interminable stairways, has been transported to the country.

In fig. 145 we show the new design for modernizing, in a tasteful manner, this clumsy exterior. By an addition we give more room upon the two principal floors, so that even a moderate-sized family may abandon, for their own

use, both basement and garret. A broad and spacious veranda, with *porte cochere* at one end, adds greatly to the outside enjoyment and appearance, and the exterior outline and shadow so managed as to make a pleasing impression. The grounds and other surroundings have also been differently planned; a handsomely curved line of roadway takes the place of the straight-line communication with the highway. The orchard of apple-trees which surrounds the house will be thinned out and planted up with ornamental trees, thus breaking up the parallel lines. The lawn in front is to be kept smooth, clean, and handsome, and all the awkward stiffness of house, grounds, and shrubbery changed to the graceful ease of an inviting country house with a neat and spacious foreground. All this is accomplished with a small expenditure of money, which, however, might have been saved on the start by one wise enough to employ the proper talent to aid him in the design.

COMPUTING COST.

A SIMPLE and rapid plan for estimating the cost of any building is by comparison. If carefully done, it will give figures that may be relied on. We have said before that it would be productive of much mischief to name prices in a book like this. The only prices we could give would be local ones, and these are changing here every day. We were of this opinion when we prepared "Woodward's Country Homes," a book that has met with extraordinary success, and has been ordered from every quarter of the globe; and experience thus far confirms us in the belief that the opinion then formed was correct.

The best substitute for prices, on which confidence may be placed, is the following, a plan much used by builders to test the accuracy of their detail estimates:

We will suppose that a party desires to erect a building in the vicinity of Madison, Wis., where prices of materials and labor differ largely from New York prices. Let him select such a house already built in that vicinity as shall represent, in style of architecture and character of finish, about what he desires to construct, and of which the cost of building is known; then compute the area or number of square feet covered by the building; divide the number of dollars of cost by the number of square feet thus found, and the price per square foot is ascertained.

Thus a house 40 feet by 40 feet covers an area of 1,600 square feet; it costs \$8,000; and dividing \$8,000 by 1,600, shows \$5 per square foot. Now what will be the cost of a similar house covering 1,400 square feet?

$$1,400 \times \$5 = \$7,000.$$

This plan will do very well to approximate roughly to cost. A better and closer one is to ascertain the cost per cubic foot. Thus, a house 40 feet by 40 feet, and an average height of 30 feet. $40 \times 40 \times 30 = 48,000$ cubic feet, cost \$7,200, or fifteen cents per cubic feet. Then a house containing 57,000 cubic feet, at fifteen cents, would cost \$8,550. Where all conditions of comparison are equal, such as equal facilities for buying, equal advantages in capital, credit, good management, etc., one can very closely by, this last method, ascertain about the cost of such a building as he proposes to erect.

FIG. 153.

FIG. 154.—CELLAR PLAN.

FIG. 155.—FIRST FLOOR.

FIG. 156.—SECOND FLOOR.

DESIGN No. 51.

THIS cottage shows a somewhat different construction outside from those already given, and although it adds somewhat to the expense, gives more variety.

Such a plan as this can be added to advantageously whenever desirable to do so. Indeed, most of the plans given admit of additions; and one advantage of the Rural Gothie style is, that every wing put on increases the exterior effect. Add almost anything in keeping with the original structure, let the roofs be on different levels, and the building will assume the appearance of a pile of buildings, irregular in outline and prolific in beauties of light and shadow.

Finish the walls with two coats of mortar and one coat of hard finish; on the lower floor put in a simple cornice, and omit all plaster ornaments. Stain and oil or varnish all interior wood-work; do not paint any room but the kitchen. In this manner you can get a warm and pleasing effect, and have the wood-work always free from dirt. Good effects can be produced by staining moldings and panels to resemble different varieties of wood; or our native hard woods can be used with fine effect, if expense is not considered. It may not generally be known that all mahogany and rosewood furniture is stained, the natural wood being very much lighter in color.

- O O, Orchard.
- Fruit around garden.

DESIGN No. 52.

PLAN FOR LAYING OUT A LOT TWO HUNDRED AND FIFTY FEET BY THREE HUNDRED AND TWENTY-FIVE FEET.

THE lot for which this design was made had one side irregular, as shown, but the planting has been so managed that no one would suspect that such an abruptness existed. Two separate lawns are shown, divided by the carriage drive. The lawns are planted on their outer edges, but are better open and clear from all shrubbery in the interior. They should, throughout the growing season, be closely mown at least every two weeks. The drive from street to house should be 10 feet wide, and finished with a hard, smooth, and evenly graded surface, and kept free from weeds; edges of lawn to be trimmed neatly as often as required. Whatever is done in the way of ornamental grounds should be well done. Nothing looks so shabby as neglected walks and overgrown lawns; better not make any attempt to lay out the grounds tastefully, unless there is a disposition to keep them neat and well ordered. The stable is planted out in such a manner as not to be seen from the house, and the general arrangement of the grounds is such as will make them attractive and convenient. The lot contains about two acres, abundantly large for one whose business is elsewhere. No one need ever be in want of occupation for his leisure hours when he has two acres to embellish and see to its neat keeping.

FIG. 168.—SECOND FLOOR.

DESIGN No. 55.

A FARM-HOUSE.

THIS design shows a neat and compact farm-house, covered by a plain roof, without hips or valleys, with a number of conveniently arranged, but not very large, bedrooms. It must be understood that these designs, in all cases, admit of many changes; that is, rooms may be made larger or smaller, and increased or decreased in number; the exterior in one design may be used for the ground-plan of another, or the good points of several plans may be collected and an entirely new plan re-arranged from them, and an exterior adapted to it. In all designs shown, the perspective view is adapted to the plans connected with it; and in making changes there are many points to be thoroughly considered. In some instances it would be necessary to reverse the plan; that is, change the location of rooms from one side to the other, in order to take advantage of the exposure.

That we should succeed in meeting in all respects the wishes of any one person, we do not expect; yet repeated instances have come to our knowledge of buildings having been put up in exact accordance with our published plans. We believe, however, that we do give every one who contemplates building, suggestions and plans of great value, and one can, with a little ingenuity, adapt the hints to suit his own peculiarities.

DESIGN No. 56.

PLAN FOR LAYING OUT A TEN-ACRE LOT FOR SUBURBAN
OCCUPATION.

BY E. FERRAND, DETROIT, MICH.

THIS place has two main entrances, with well-shaded drives. The lodges for the gardeners command the gates. There is an immediate access from one of these cottages to the hot-beds and garden, which are exposed to the full sun. The sight of the vegetable garden is entirely hidden by a belt of ornamental planting. Around the greenhouse and graperies are flower-beds and rustic seats, with a nice walk around. Rhododendrons and kalmias can be planted on the northern and other shaded sides of the dwelling. The access is very easy to the stables and other out-buildings, with two yards and a direct access to the street. The river and lake occupy about half an acre. There are two islands, one of which is connected with the garden by a small bridge. The space O can be cultivated with fruits of any kind, or put in grass.

It has been my aim to make this a handsome place, with but few roads. In fact, a simple glance at the drawing will tell more about the disposition of this place than any explanation.

FIG. 170.—A SCHOOL-HOUSE.

FIG. 171.—GROUND PLAN.

DESIGN No. 57.

A COUNTRY SCHOOL-HOUSE.

BY GEO. E. HARNEY, ARCHITECT, COLD SPRING, N. Y.

WE present at this time a sketch of a country school-house, of suitable size and accommodation for about fifty pupils, of both sexes.

It is a plain building of wood, comprising a central portion and two wings, one on each side. The main building measures 21 feet by 42, and the wings 12 by 17 each. The principal school-room measures 20 feet by 30, and is 12 feet high to the spring of the ceiling, and 17 feet high in the center of the room, the ceiling for a portion of the way following the slant of the rafters, and the principal rafters and braces projecting out so as to show from below. The walls of this room are wainscoted up to the level of the window-sills—4 feet from the floor—with narrow ceiling boards, and above that, together with the ceiling, are finished off with a rough and stucco finish.

The wood-work should all be stained, and the walls tinted some soft neutral tint—gray, or cream, or pearl color.

The windows are all sash windows, double-hung for purposes of ventilation; and, in addition, there are two ventilating shafts rising from the floor through the attic,

and terminating in the ventilator on the ridge of the main roof. These shafts have openings near the floor and ceiling, with arrangements for opening and shutting at will. They are made of smoothly-planed, well-jointed pine boards, and measure each 16 inches square inside.

In order to keep up the circulation, and to supply cool air from outside, a shaft is introduced running along under the floor, and terminating at the platform on which, in winter, the stove, or heating-apparatus, will stand, and from this distributed into the room by numerous small holes in the riser of the platform.

We consider the simplest methods of ventilation the best, and the above will be found both simple and effective. The great desideratum is to provide means for the discharge of a certain quantity of vitiated air, and to supply its place by the same quantity of pure air, properly warmed in winter. To make the discharge more effective, the stove-pipe may be carried up in connection with one of the shafts, rarefying the air, and making the upward current stronger; but in ordinary cases this will be hardly necessary.

There are two entrances to this house, one for boys and one for girls. Both entries are 10 feet square, and are in the main building, opening directly into the school-room.

The wing on the right is a class-room, and that on the left is designed for wood and coal, and for a wash-room, if such be considered desirable.

The entries, instead of having hooks for clothing, have each a sufficient number of boxes or shelves divided up into compartments of about two cubic feet each, ranged

along the sides, and carried up in three or four tiers. These boxes are all numbered, and each scholar has one for his own exclusive use; being provided with a duplicate number as a voucher, there is no opportunity for contention as to ownership, no losing or abusing of hats and shawls, and dinner-pail. The method has been tried, and found much preferable to the old arrangements of hooks, particularly for the smaller scholars, and those coming from a distance who bring their dinners.

The two porticoes measure 8 feet by 10; the windows have all broad hoods and brackets; the gables have heavy finials, and the ridge is surmounted by a large ventilator. The roofs are covered with slates, and the walls are painted two or three coats of oil paint.

FIG. 172.—DESIGN FOR ENTRANCE GATE.

DESIGN No. 58.—A GRAPE ARBOR.

BY E. A. BAUMANN.

FIG. 173.—SIDE VIEW OF ARBOR.

FIG. 174.—DETAIL OF ARBOR.

FIG. 175.—DETAIL OF ARBOR.

FIG 176.—CROSS SECTION.

DESIGN FOR A GRAPE ARBOR.

THE accompanying design for a grape arbor, in the style of an Italian pergola, has been introduced in several places with success.

This arbor is more an ornament to a place than arbors generally, which are intended more to hide nuisances, but which show them in the best way to everybody that comes near a house.

By the design, it will be seen that the arbor is open on the front side, with a balustrade or panel work of $3\frac{1}{2}$ or 4 feet high from the ground.

The rear is covered with laths, 12 to 15 inches apart, for the purpose of training grapevines intended to run on the top, along the cross-pieces.

FIG. 177.—TOP OF ARBOR.

This arbor could be built of almost any kind of timber, and painted any shade; but a wood color, imitating oak or chestnut, would be the most suitable.

The upright lattice-work, running along the posts, is in-

tended to give the posts a heavier appearance, and to tie up flowering climbers that will have to be trained lengthwise along the upper piece of timber.

The horizontal pieces run across the posts, tying them together and supporting the laths, $2\frac{1}{2}$ by $3\frac{1}{2}$ inches, which are lying crosswise over them, and project some 15 to 18 inches out.

Vines dropping from the top will soon make the whole more heavy.

When first employed or introduced, this style of arbor was either to shut out some objects outside the place, on parts of a small lot, where a group or a belt of shrubbery would not have found room enough, or to establish an ornamental terminus in the pleasure ground, and a separation between this and the vegetable garden.

With a well-selected collection of climbers, this arbor would soon be a very handsome feature in a place. Tall-growing varieties of climbers, like wistarias, clematis, running roses, etc., may be trained on the posts; and dwarfer sorts, like honeysuckles, akebia, bignonias, jasminums, the annual varieties of ipomæas, tropæolums, etc., may be employed along the base.

In case this arbor should be placed on the boundary line of a place, the rear on the north side would not answer well for grapevines; but in that case, I should suggest to cover the rear entirely with the Virginia creeper, aristolochia sipho, or some other fast-growing climber succeeding well in the shade.

WITHIN DOORS.

[THE following hints were originally published in the HORTICULTURIST. They were written by Dr. D. D. Slade, of Boston, Mass., and we commend them for their sound teachings.]

It is not alone to the outward embellishment of the country home that art and taste should be directed. The influence of these should be shown as well in its internal arrangement and adornment, and that, too, in a way to conduce to the welfare and happiness of the family, and indirectly to promote that genial, unrestrained sociability which should ever characterize country life. To the full accomplishment of this, our rural communities, possessed as they are of ample means, need only to have their good sense and judgment properly directed. Toward this end but little has as yet been said or done, while, on the contrary, much thought has been given to rural embellishment in the usual acceptance of the term.

How can we hope to effect that which is so much to be desired? How can we best make known the necessary suggestions to those who might profit by them? We can have no better means than those which the pages of the HORTICULTURIST present.

There are certain little foibles, of which our country neighbors, particularly in New England, are guilty, which we heartily wish were abolished. For example, we would that the spirit, not always to be attributed to meanness, were done away with, which shuts up every portion of the

dwelling, even against its own inmates, excepting perhaps a single apartment. In that delightful book, "My Farm at Edgewood," the author gives us a faithful picture of this failing too commonly met with; and the death of poor Dorothy, and the opening of the darkened parlors, is a true sketch of what takes place every day in almost every country village.

We would gladly see the money now expended in the trashy, half-made articles of furniture, merely because the uncomfortable shapes of some of them are said to be of the latest style, laid out for those which are truly strong and serviceable, and, for this reason, elegant.

We grieve to know that there are families who would willingly dispose of ancestral relics—choice heirlooms that they are, in the shape of solid mahogany chairs, lofty chests of drawers with curiously-wrought brass handles, elaborately carved bureaus, claw-footed tables, etc., all in perfect preservation, and all of which would long outlive their present owners, as they have their preceding ones—to supply their places with modern articles, with chairs and sofas upon which no mortal man could ever sit or recline with the least degree of comfort, and with beds and bureaus which soon melt away before the blasts of our modern stoves and furnaces.

We would wish that less dependence were placed in these very stoves and furnaces, and that an open fire-place existed in every room, thus securing ample ventilation and cheerfulness, and thereby contributing to good health and happiness. That at the proper seasons every blind and curtain in the country home should be thrown open to ad-

mit the genial sunlight. That the light from the blazing wood-fire, as it dances on the walls and ceiling, should show to the belated traveler as he passes, the forms of a happy group gathered about the ample chimney place.

These are but a tithe of the changes which would exert ourselves to bring about among the intelligent of our rural population. As regards the arrangement and adornment of the interior of the country dwelling, we shall speak more especially of the dining-room.

There is nothing more essential to the comfort, and consequently to the happiness, of the family, than that the dining-room should be, of all the apartments of the house, the most pleasant and the most attractive. And to this end, the first requisite is, that it should be properly placed. In building, or in the occupation of the residence already constructed, let that room be selected for the purpose into which the morning sun at least shall throw its cheerful rays. In our cold climate, at no time is its presence more welcome than at the breakfast-table. If practicable, let both the morning and evening sunlight illuminate the room. These points can be attained by the choice of the southeastern exposure. It is not uncommonly the case, that the most dreary, forbidding room in the house has been chosen for the daily repasts—a room into which no sunshine ever pours, and whose whole aspect partakes of that gloomy spirit which too often broods over the tables of our people. We are great advocates for the admission of the sun, especially into those rooms which are occupied throughout the day, and in the construction of a country dwelling, where choice of position is

almost invariably to be had, this important point is to be kept most distinctly in view. Where his beams penetrate, household neglect on the part of mistress or dependents is not so apt to be tolerated.

And who can estimate the moral influence which a cheerful, sunlighted, tastefully-arranged room exerts over the members of a household, especially over the younger portion? An influence which shall go with them through life, and which shall build up happy associations, to which their minds shall ever joyfully revert, wherever in the broad world may be their habitation.

In the picture which we should form of what a dining-room ought to be, certainly so far as regards the essential points of which we have spoken, we can not do better than to present a description of our own, for to us at least it embodies all that is requisite for the growth and encouragement of that home-feeling which we would ever see manifested in our children.

We have a decided penchant for all that smacks of antiquity. We like old houses and old furniture, particularly if comely and serviceable. We delight in painting to ourselves the scenes through which they must have passed; we believe, too, that they exert a much greater influence in producing a love for home than those constructed at a more recent period. Having premised thus much, we will say that our house is old, with a gambrel roof; that its location is a delightful one; that we have refined and agreeable neighbors, and those not too near. The dining-room has a bay-window to the southeast, and two windows with a southerly aspect. The morning and evening sun

throughout the year gladdens it with its presenee. The apartment is of fair dimensions, the ceiling low—so low, that in the moments of play and during temporary forgetfulness we have brought the heads of our children into very dangerous proximity.

The principal feature of the room, and the one in which we take the most delight, is the big open fire-place, which will admit as large a log as one can conveniently bring in. The back and jambs are of brick, well blackened with the soot of many a generous fire. The tiled hearth is broad and long; well-polished brass andirons and fenders, with the accompanying shovel, tongs, and bellows, all necessary appendages to the fire on the hearth, are each in their appropriate places.

And what would induce us to part with the cheery and happy spirit which this old fire-place continually infuses into our little family—whether at the morning hour, when we first assemble around the table, or at the “children’s hour,” between daylight and dark, when we gather around its hearth to listen to some oft-read story or to recite some well-known adventure! A Turkey carpet of pleasing colors and of thick texture, an article which, in our minds, is always associated with substantial old-fashioned families, contributes greatly to our comfort. An antique side-board, convenient both in its external and internal arrangements, with a half dozen high-backed mahogany chairs, telling of Dutchland, not to forget a more luxurious arm-chair, constitute the movable furniture. Simple, unostentatious woolen curtains hang at the bay and other windows, supported upon black walnut fixtures. These may be

easily dropped at night, shutting off, if necessary, the recess of the bay-window, and thereby adding amazingly to the cosy, secure feeling in which we love to indulge in the long winter evenings of the country. Numerous engravings adorn the wall, not in gilded frames, but in those made of hard wood, merely polished and not varnished, and simple in design. Beside the ancient clock and bronze candlesticks, numerous little objects, tokens of kind remembrance, adorn the broad and ample mantel-shelf. Plants, whose flowers have delighted us through the dreary season of winter, find a congenial atmosphere and plenty of sunlight in the bay-window. It is hardly necessary to state that a convenient pantry and a good closet, adjuncts which can not be dispensed with in the well-ordered household, are contiguous.

Such are the principal features of our dining-room. While we have seen many that are more spacious and elegant, we have rarely seen any that contained within it more that was essential to comfort or that was more calculated to make a stranger feel at home.

We have been thus particular in our description, for the reason that we would dilate more fully upon certain points.

Of course, we could not hope to govern all tastes, but in such a matter as the selection of a carpet for a country dining-room, we should advocate the choice of one modest, not only in color, but in design. So also with the coloring of the walls, whether by paint or paper, we should be governed by similar rules of fitness—giving our preference to some warm neutral tint, and most decidedly es-

chewing white, as a color totally unfitted for either adornment of exterior or interior.

Drapery curtains, however simple in their fabric or construction, contribute greatly to the appearance of a room, doing away with that bareness which is never agreeable, at least during the cold season. For their accompanying fixtures, the various species of hard wood simply polished are far preferable to the gilded, which are less suitable in the country, being more tawdry and more easily destroyed. The same remarks apply also to the frames of engravings, and in many cases even those of oil paintings. These may seem to be matters of trifling importance, but they all go to show the presence of good sense and a refined taste ruling over a household.

Plants, whether upon a stand or hanging in appropriate pots at the window, add amazingly to the cheerfulness of any room, contributing to the pleasure of those who care and tend for them. They serve also as useful barometers, telling us, by their condition, of the atmospherical state of our apartments, their delicate organization being unable to stand against the injurious emanation from overheated furnaces. Mr. Rand, in his pleasant book upon flowers, says, "A plant or a stand of flowers is a constant source of pleasure in a room; it is a spring of sunshine, and its silent influence makes all the household more cheerful and better."

Finally, a certain degree of harmony should be preserved in all that concerns the internal embellishment of the country home, a point which is very apt to be overlooked by those otherwise correct in their tastes.

TRACING CURVED LINES FOR ROADS, WALKS, Etc.

a, b, c, being a tangent or straight line, from the point *b* we proceed to lay out a curved line; 5 feet from *b*, at *d*, lay off the distance 6 inches, and set the stake at 1, 5 feet from *b*, and 6 inches from *d*. Then from *b*, through 1, produce the straight line to *e*; 5 feet from station 1 lay off the deflection distance, 12 inches, and set the stake 2 5 feet from 1, and 12 inches from *e*. Then repeat the same operation, setting stakes 3 and 4, all of which will be found to be in the arc of a circle. If the wish is to pass into a tangent or straight line, the next distance will be but 6 inches, or the first and last distances in running from and on to a tangent are always half the others, and are usually called tangential distances. To sharpen the curve, lay off in the same direction from the tangent already found on the first curve, any tangential distance greater than 6 inches, which in this case we make 9 inches, and set stake No. 5. Then produce the straight line from stake 4 through stake 5 to *f*, and lay off the deflection distance 18 inches to stake 6. Set stake 7 in the same manner; then run on to a tangent by setting off $\frac{1}{2}$ the deflection distance at station 8, and producing a straight line from stake No. 7. At station 7 we reverse the curve. From the tangent of the curve just run, lay off, on the opposite side, the tangential distance 6 inches, and set station 8; then produce the line from 7 through 8 to *g*, and lay off the deflection distance 12 inches from *g*, and set station 9; then produce the line from 8 through 9 to *h*, and lay off 12 inches to

gent between them, if there is any way to avoid it. A tangent between reverse curves improves their appearance.

This principle of tracing curves is very simple and rapid, and requires no revision to ascertain if they flow gracefully and correctly. There is no necessity for clearing the ground, removing fences or other obstructions, as the line can be continued whenever two stakes can be seen. Mathematically speaking, there is a very slight difference to be detected in demonstrating this problem. In practice, however, this trivial difference can hardly be said to cause any departure from absolute accuracy. We merely mention this lest some hypercritical theorist might think he had discovered something.

An expert, familiar with this process, has a wonderful facility in executing work, while those who work by the eye only will remain in the background. He does at once what they spend hours or days to attain, as the same harmony and grace of line is the object of both.

A measuring tape and rule and a plumb-line, or a couple of light thin rods, are all the instruments necessary to do the work. It requires considerable practice to select the proper curve at first, but one or two trials will give the right deflection distances. Trial lines of this kind, we find, enable us to ascertain in the easiest and quickest manner the proper radius of a curve, without the necessity of making an instrumental survey. As a matter of economy and beauty, this system recommends itself strongly; and in a very extensive professional practice we have found its merits above all others.

DESIGN No. 59.

It frequently happens that a plan is called for which will admit of future additions, as family and fortune increase. Many are deterred from building in consequence of the expense of building on a larger scale than their necessities require, and are hardly willing to put up a structure to be torn down a few years after. But if a house adapted to present wants can be had, and hereafter become a useful and harmonious portion of a more commodious dwelling, the objection named is obviated. In the city, one's social position is regulated as much by the house he lives in as by the company he keeps or the clothes he wears. In the country, let one live in ever so humble a cottage and his position is not altered by it. If furnished and embellished in good taste, it rather advances the position than otherwise. Real, substantial comfort in country life will always take precedence of any attempt at show.

The accompanying design shows a cottage of moderate pretensions, and which can be erected at the present time (April, 1868,) in the suburbs of New York for \$1,500 to \$1,800. The kitchen is designed to be in the basement, with cellar, and a small laundry adjoining. The amount of room on first and second floors is shown on the plans. The frame is to be built in the Balloon style, which is the strongest and cheapest, and may be filled in

FIG. 179.—COTTAGE.

with soft brick on edge, or double boarded and interlaid with roofing felt. The main roof to be of slate, and if of small sizes and cut to hexagon pattern, would have a pretty effect. Our taste would be to use one color only, the dark blue. Slate roofs cost but a trifle more than shingles, and the rain water is so clear and beautiful as to render well or spring water unnecessary. Piazza and bay window roofs to be tinned, and gutters and leaders from all roofs to a cistern. Exterior finish to be plain, good and substantial, and to be painted a light cream or warm gray tint, with rich brown trimmings. The walls throughout to be hard finished white, and after a year or two to be papered.

The first plans of the house are shown by the dark lines; the addition to be put up at some future day is indicated by the light lines. When this is done, it is intended to remove the stairs shown, make the necessary alterations in partitions, etc, and use the entire present hall and dining-room for an enlarged platform stairway, vestibule, hat-closet, etc., with an arched lobby communicating from vestibule to future parlor. The present parlor will become the future dining-room, communicating directly with kitchen through waiter's pantry "D." The present front-door opening will be enlarged to correspond with the double window and folding doors substituted. The closet in the rear will become a lobby, communicating with future kitchen, and through new lobby "E" with future library "F."

The index letters on the plan of the addition indicate future rooms, etc., respectively, as follows:

| C, Dressing-Room..... | " 6 x 9½ " | c, Attic Stairs. |
| D, Lobby, 4 feet wide. | | |

FIG. 182.—FRENCH REV. COTTAGE.

DESIGN No. 60.

THE French roof is very popular in almost all sections, gives more available space than the gothic, and when well managed is effective in appearance. The design shown contemplates a moderate expenditure; and in this,

FIG. 183.—PLAN FIRST FLOOR.

as in the previous design, part of the work is to be left for future completion. By omitting the finish of the attic and constructing the building in a good but plain manner the cost should not exceed \$3,800. This price would provide but one mantel for the parlor, and does

not contemplate either heating or plumbing. The cellar ceiling to be 7 feet; first floor ceiling, 10 feet; second, 9 feet; and attic, 9 feet; the deck-roof to be tin and the lower roof to be of slate. The attic plan is given to show the arrangement, and can be finished at any future time. This plan would answer well for a suburban lot 50 feet front, and will be found to meet most of the

FIG. 184.—PLAN SECOND FLOOR.

requirements of a country house. The hall, through the centre, gives independent access to all rooms, and affords thorough ventilation in warm weather. The parlor is amply large for all purposes, and the general situation of the rooms is such that they can be economically heated.

In the preparation of house plans, nothing pays so well as careful study. Ten per cent., and sometimes as much as twenty per cent. of the cost of the house can be saved by skillful treatment in construction and arrangement. Cheap plans are the most expensive portions of house-building, and generally more profitable to make

FIG. 185.—PLAN ATTIC FLOOR.

than those on which the most thorough care and study have been expended, and for which the customary price for good work has been paid. Better bestow more thought and more money on the plan, and get the best house possible for the price contemplated.

DESIGN No. 61.

THE design for this house was prepared to answer a popular demand, that shall embrace, at a low price, the long-prized excellencies of the old-fashioned country

FIG. 186.—GOTHIC COTTAGE.

house, with hall through the centre and doors at both ends to give ample ventilation in warm weather. With all the progress that has been made in architectural con-

venience and embellishments, we doubt if the central hall and independent communication with all rooms have been much improved on. The finest country houses with which our associations are connected, and which are remembered for their comfort and elegance, had the spacious hall running through the centre.

FIG. 187.—PLAN FIRST FLOOR.

It will be observed in this design, that as far as possible all angles have been avoided, and the construction planned for straight-forward square work. The roof of the addition is nearly flat and tinned, and the ridge finished below the plate of main roof. The principal roof is covered with slate, cut to hexagonal pattern, has a square pitch, and except the connection with central
